EDUCATION

University of Colorado Boulder

Boulder, CO

B.A. in Computer Science (GPA: 3.94)

Expected May 2028

- *Honors:* Boettcher Scholar, Undergraduate Enrichment Program, Engineering Honors Program
- *Clubs:* CU Blockchain Club (President), CS Undergraduate Advising Committee (Head Chair)
- *Relevant Coursework:* Software Development, Algorithms, System Architecture, Database Systems

WORK EXPERIENCE

Software Engineer Intern

May 2026 – Aug. 2026

Gemini

New York City, NY

- Designed and led the creation of a new onchain compliance enforcement service, defining the threat model and phased rollout strategy before implementation
- Owned end-to-end engineering scoping, breaking the project into actionable milestones and implementation tickets
- Built a low-latency gRPC service that reconciles risk signals for onchain addresses, merging internal and external vendor results into a unified risk verdict
- Architected a Kafka-driven asynchronous completion engine that ensures required post-transfer compliance obligations reach a terminal state through Redis-based leader election
- Instrumented structured Datadog metrics and built companion dashboards with no-data and threshold monitors to enable staleness alerting

Information Technology Manager, Computer System Administrator

May 2023 – Aug. 2025

Alamosa School District

Alamosa, CO

- Led IT support operations for 3,000+ devices across a district serving 2,100+ students and 440+ staff
- Oversaw and coordinated a summer tech team, facilitating task delegation, daily standups, and team workflows
- Streamlined laptop imaging processes, performed hardware repairs, managed district-wide device inventory, and assisted with classroom technology maintenance

PROJECTS

Distributed Consensus System | C++, TCP Sockets, Multi-threading, Cryptography

Nov. 2025

- Built distributed peer-to-peer network in C++ featuring proof-of-work, transaction processing, and consensus mechanisms to maintain consistent state across nodes
- Implemented multi-threaded TCP server handling concurrent client connections with mutex-protected shared state and JSON-based inter-process communication protocol
- Designed automatic chain synchronization to resolve competing chains and restore consistency through longest-chain selection
- Applied SHA-256 hashing and Merkle tree data structures to ensure tamper-evident transaction validation in a distributed environment

Base Bets: Onchain Escrow (MBC Hackathon) | TypeScript, Node.js, Smart Contracts

Dec. 2025

- Architected and deployed smart contract system with account abstraction to enable gasless transactions, reducing user transaction costs to sub-cent levels
- Integrated external REST APIs as an oracle layer for real-world event resolution, automating financial settlement based on prediction-market outcomes
- Designed an escrow mechanism using external data sources for automated settlement in peer-to-peer financial agreements
- Implemented secure transaction handling with cryptographic signature verification and automated settlement logic

TECHNICAL SKILLS

Languages: C++, Python, Scala, TypeScript, SQL

Infrastructure & Tools: gRPC, Kafka, Docker, Nginx, Node.js, Redis, Linux, Datadog, Harness, Linear

Blockchain Technologies: Solidity, Ethereum, Smart Contracts, Hardhat, ethers.js, ERC-4337

AI-Assisted Development: Claude Code, OpenAI Codex, MCP
